

Lift and Escalator auditing & assistance - AS1735

The government classifies them as HIGH RISK PLANT!

Ask your MINC manager for information which can help you save money and time.

Every year around 2,500 – 3,000 new lifts and escalators are installed in Australia. We now have in excess of 45,000 lifts and escalators in service. On average each one of these 45,000 units will breakdown once every 2 months. That's roughly 270,000 stoppages every year!

Of these stoppages – approximately 20% - 30% will involve people trapped inside the lift. Hence, as many as 90,000 times this year, somewhere in Australia, one or more people will experience the trauma of being trapped in the small confines of a lift car.

If it happens in your building are you prepared?

- Do you understand the reasons behind this number of stoppages and entrapments?
- Do you know if you comply with the special requirements for managing High Risk Plant?
- Do you know what pre-cautionary steps you could take to minimise the chances of this happening?
- Do you trust what your service provider is telling you?
- Do you know the life expectancy of this plant for your particular building application?
- Do you have adequate finances for replacement of this expensive equipment?

These are just a handful of the questions you must be able to answer.

From our extensive range of lift related services we can help you to find solutions.

DON'T RISK BEING CAUGHT UNPREPARED!

*Simply stated,
we provide your team with*

*Professional Solutions and
lasting Peace of Mind!*
